122921-28 represent peptides derived from any variant of natural filagorin or any variant of intermediate filament proteins. The peptides contain at least one citrulline residue which is crucial for reacting with antibodies that are present in sera from patients with rheumatoid arthritis. The peptides constitute immunogenic determinants of antibodies, methodies, immunotoxins and intermediate filament proteins can be used for the preparation of a therapeutic or of a diagnostic for rheumatoid arthritis. The peptides an also be seed for identifying compounds which modulate the interaction between an autoantigen and a rheumatoid arthritis specific autoantibody. The products can also be used for the diagnosis and treatment of other products can also be used for the diagnosis and treatment of other autoimmune diseases e.g. systemic lupus erythematosus, discoid lupus erythematosus, scleroderma, dermatomyositis, or Sjogrens syndrome.
                                                                                                                                                                                                                                                                                                                                                                  New peptide derived from intermediate filament proteins

This sequence represents a peptide of the invention, and is a derivative of the HJ loop of a scrine/threonine kinase (STK). The peptides can be used for the treatment of disorders caused by overactivity or conformation of a STK, e.g. cancer, diabetes, obesity, haemorrhagic underactivity of a STK, e.g. cancer, diabetes, obesity, haemorrhagic shock, cardiovascular diseases (e.g. thrombosis, atherosclerosis, arteriosclerosis, immunosuppressive and inflammatory disporders (e.g. asthma, psoriasis, systemic lupus erythematosus, diabetes mellitus, suppression of organ transplant rejection, multiple sclerosis, inflammatory bowel cisease and AIDS), central nervous system diseases (e.g. Alzheimer's disease and AIDS), central nervous system diseases (e.g. Alzheimer's can be used to identify cells expressing the STK and to study the intracellular distribution of the STK. In addition, the peptides can be used to identify and quantitate ligands which bind the HJ loop of the STK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Filaggrin; intermediate filament protein; antibody; rheumatoid arthritis; antigen; Immunofoxin; autoantigen; autoantibody; autoimmune disease; systemic lupus erythematosus; discoid lupus erythematosus; scleroderma; dermatomyositis; Sjogrens syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (SRC-1), and other in required for human progesterone receptor (SRC-1), and other in required for human progesterone receptor (HPR) transactivational function. SRC-1 acts as a coactivator for hPR by reversing receptor squelching. It is a coactivator for multiple steroid receptor squelching. It is a coactivator for cuterninal region of SRC-1 acts as a dominant negative regulator of steroid receptor function. An SRC-1 related disease can be created by introducing SRC-1 uncleic acid (see T84543) into a host treated by introducing SRC-1 (claimed). A molecular switch can be call and infusing the cells into the patient causing an increase in the transcription of SRC-1 (claimed). A molecular switch can be called to regulate expression for use in gene therapy. Transcription of a target gene can be decreased by providing a nucleic acid encoding a containing the target gene (also claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HJ loop; serine/threonine kinase; cancer; diabetes; obesity; therapy; haemorrhagic shock; cardiovascular disease; immunosuppressive disorder; inflammatory disorder; central nervous system disease; septic shock; Parkinson's disease; hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Steroid receptor coactivator-1 polypeptide and DNA - regulated using a molecular switch, used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide comprises human steroid receptor coactivator-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

neurodegenerative disease, acute traumatic injury, fibrotic disease and autoimmune diseases (e.g. rheumatoid arthritis and sclerosis). The UNC-53 polynucleotides can be used for recombinant production of the proteins, as a source of probes for detecting allelic variants and polymorphisms, for sequencing genomic DNA and for detecting UNC-53 expression; and as source of therapeutic antisense sequences. Cells that express the protein are used to identify regulators of cell shape, growth, motility and migration. They can also be used to identify proteins that are involved in signal transduction pathways also involving UNC-53, and to indentify compounds that alter attachment of UNC-53 to microtubules. A target gene coupled to a UNC-53 encoding sequence may be used to deliver the target gene to a cellular microtubule or its plus ends. The present sequence represents the amino acid sequence of the C. briggsae UNC-53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses methods for measuring yeast nucleotide-sugar transporter activity by determining an amount of golgi-associated nucleotide-sugar as an indicator of nucleotide-ugar transporter activity. This is used in screening for inhibitors of golgi nucleotide sugar transporter activity for use as antifungal agents. The antifungal compound inhibits golgi GDP-mannose transport and is useful in a pharmaceutical composition for inhibiting growth of yeast in a patient. The methods, proteins, nucleotide sequences and antibodies are useful for detecting VRG4 and its gene in samples and for determining the efficacy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vanadate resistance glycosylation 4; VRG4; nucleotide-sugar transporter; golgi-associated nucleotide-sugar; golgi GDP-mannose transport; nucleotide-sugar transporter activity; inhibitor; antifungal;

of treatment by an antifungal compound. In process, (VRG4) Candida albicans vanadate resistance glycosylation 4 (VRG4) protein that transports GDP-mannose from the cytoplasm into the lumen of the golgi complex. VRG4 protein or immunogenic portions are useful in eliciting anti-VRG4 antibody to be used in diagnostic assay and as a therapeutic to inhibit transporter activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the human SRC-1 protein ligand binding region corresponding to amino acids 384-782 of the full length protein. The protein can be fused to reporter proteins and used for screening for intranuclear receptor protein that bind the ligand.

                                                                                                                                                                                                                                                                                                                                                                       q
 The invention provides vertebrate (human) protein homologue of a UNC-53 protein of Genorhabditis elegans. The UNC-53 binds to microtubules or their plus ends. The UNC-53 binds to microtubules or their plus ends. The UNC-53 sequences are used to promote neural regeneration, revascularization and wound healing; also for treating neurodegenerative disease, acute traumatic injury, fibrotic disease and neurodegenerative disease, acute traumatic injury, fibrotic disease and neurodegenerative disease, acute for recombinant production of the proteins, as a source of probes for detecting allelic variants and polymorphisms, or sequencing genomic DNA and for detecting UNC-53 expression; and as source of therapeutic antisense sequences. Cells that express in protein are used to identify regulators of cell shape, growth, motility or and migration. They can also be used to identify proteins that are involved in signal transduction pathways also involving UNC-53, and to identify compounds that alter attendance of UNC-53 to microtubules. A target gene to a cellular microtubule or its plus ends. The present sequence represents the amino acid sequence of the C. elegans UNC-53 price variant (EST clone yx480b6).
                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

UNC-53 protein variants 8A and 7A of Caenorhabditis elegans are new. The UNC-53 proteins and nucleic acids are useful as medicaments to promote neuronal regeneration, revascularisation or wound healing, or for treatment of chronic neurodegenerative diseases (e.g. Alzheimer's or Huntingdon's disease) or acute traumatic injuries. Transgenic cells and organisms transfected with UNC-53 CDNA can be used to determine whether a substance is an inhibitor or enhancer of the regulation of cell shape or motility or the direction of cell migration by screening for a phenotypic change in the cell. Inhibitors can be used to alleviate the spread of disease inducing cells or metastasis. Probes derived from the CDNA sequences can be used to identify homologues of the C. elegans unc-53 gene. The UNC-53 protein can be used to identify proteins which are actived in the signal transduction pathway that can be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides vertebrate (human) protein homologue of a UNC-53 protein of Caenorhabditis elegans. The UNC-53 binds to microtubules or their plus ends. The UNC-53 sequences are used to promote neural regeneration, revascularization and wound healing; also for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              anticancer; anti-neurodegeneration; antifibrotic; anti-adhesive; human; antisclerotic; antimetastatic; anti-arthritic; autoimmune disease.

The UNC-53 proteins and nucleic acids are useful as medicaments to promote neuronal regeneration, revascularisation or wound healing, or promote neuronal regeneration, revascularisation or wound healing, or promote neuronal regeneration, revascularisation or wound healing, or the treatment of chronic neurodegenerative diseases (e.g. Alzheimer's or Huntingdon's disease) or acute tranmatic injuries. Transgenic cells and organisms transfected with UNC-53 cDNA can be used to determine whether a substance is an inhibitor or enhancer of the regulation of cell shape or motility or the direction of cell migration by screening for a phenotypic change in the cell. Inhibitors can be used to alleviate the spread of disease inducing cells or metastasis. Probes derived from the cDNA sequences can be used to identify homologues of the C. elegans unc-53 gene. The UNC-53 protein can be used to identify proteins which are active in the signal transduction pathway that can be used as mentioned above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   UNC-53; Caenorhabditis elegans; microtubule; neural regeneration; anticancer; anti-adhesive; human; antisclerotic; antimetastatic; anti-arthritic; autoimmune disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes lung tumour specific polynucleotides and tumour antigens. 207144 to 207246 and 208311 to 208325 represent specifically claimed polynucleotides, and 729486 to 729571 represent amino acid sequences from the present invention. The lung tumour specific polynucleotides and polypeptides can be used in pharmaceutical compositions and vaccines to inhibit the development of lung cancer. They can also be used to detect lung cancer in a patient. Probes and antibodies derived from the lung tumour sequences are useful in
                                                                               Human; lung tumour protein; therapy; diagnosis; lung cancer; vaccine; lmmunotherapy; detection; inhibition.

                                                                                                                                                                                                                                    ;
cartilage, bone, nerve and muscle, particularly in cases of subglottic stenosis, chondromalacia patellae, osteoarthritis, joint surface lesions, neurodegeneration (e.g. Alzheimer's disease), myodegeneration or osteodegeneration. They also modulate Wnt-mediated signaling in cells, and are used to inhibit growth of Wnt-expressing tumours (particularly mammary or intestinal). The Frzb genes may also be used to identify specific modulators or as a growth factor for cells of the chondrocyte lineage in vitro, to stimulate wound healing, to promote angiogenesis, to prevent transplant rejection and as adjunct to chemotherapy or immunotherapy. Fragments of Frzb proteins are used for detecting genetic abnormalities associated with Frzb genes.
                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence encoding the bovine frezzled protein (FRZB) used in the method of the invention involving the human frezzled-like protein (HPLP), It is a member of the frizzled protein family. It is used in the detection and treatment of differentiation-related disorders. In conditions where HFLP is under-expressed, its agonist is involved in the treatment. Antagonist and antibodies of HFLP are used in the treatment of disorder where HFLP is over-expressed, e.g. the regulation of haematopoiesis, and wound healing. HFLP products are used to develop products for treating e.g. cancers, inflammatory

                                                   A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HITDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a cDNA clone (T5619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HITDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism hypophosphataemia, kidney stone, nephroliasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     probe specific for m-RNA

a heterologous promoter in an expression vector can be used to produce recombinant Frzb proteins. The Frzb proteins may be formulated with fibrin glue, freeze-dried cartilage grafts or collagen (optionally also cartilage progenitor cells, chondroblasts or chondrocytes). They are coated on to, or mixed with, a (non-)resorbable matrix, or mixed with a biodegradable polymer. They modulate activity of the growth factors Wnt-1 to 8. The Frzb proteins induce skeletal morphogenesis, embryonic pattern formation and tissue specificity and are used to induce growth of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This represents a bovine growth-inducing protein Frzb. Bovine, human and Xenopus Frzb genes which are shown in V18253 to V18255 are related to the frizzled gene in Drosophila. The corresponding bovine, human and Xenopus Frzb protein sequences are shown in W48694 to W48696. A recombinant construct containing a Frzb encoding nucleic acid linked to

-!- SUBCELLULAR LOCATION: NUCLEAR.
-!- TISSUE SPECIFICITY: OVARIES AND EMBRYONIC CENTRAL NERVOUS SYSTEM.
-!- DEVELOPMENTAL STRACE: MAJOR EXPRESSION IS SEEN IN THE OVARIES WHILE MODERATE LEVELS OF EXPRESSION ARE OBSERVED DURING EMBRYOGENESIS AND THROUGHOUT SUBSEQUENT STRACES OF FLY DEVELOPMENT.
-!- SIMILARITY: TO YEAST YNLO33C AND HUMAN NFXI.

w12726-W12769 represent conotoxin peptides. This sequence represents the A-lineage conotoxin ST-1 peptide isolated from Conus striatus. These sequences are identified using the method of the invention. The method of the invention is for identifying DNA encoding A-lineage conotoxin of the invention is for identifying DNA encoding A-lineage conotoxin sequences (see T59714 and T59715). The primers are specific for the signal sequence and 3'-untranslated (3'UTR) regions of the conotoxin gene, which are highly homologous between conotoxins, and are therefore suitable sites for detection. A-lineage conotoxins, and are therefore conotoxins, and kappa-conotoxins are powerful.

Conotoxins, and kappa-conotoxins at the neuromuscular junction, and are usually nicotinic acetylcholine receptor blockers. Kappa-conotoxins are usually incotinic acetylcholine receptor blockers. The conotoxins identified can be used as muscle relaxants, in the diagnosis of myasthenia gravis, and for the treatment or diagnosis of small cell ung cancer. For the treatment of small receptors, and thereby blocking peptides act by binding to the nicotinic receptors, and thereby blocking the nicotine receptors, and the mitogen 5-hydroxytryptamine

Fukuyama-type congenital muscular dystrophy-causing protein.

```
ò
The present sequence represents a Fukuyama-type congenital muscular dystrophy (FCMD)-causing protein isolated from human. Also described in the present invention is a method for the detection of gene abnormality for FCMD diagnosis by detecting the presence of a mutated the FCMD-causing DNA having a mutation causing functional insufficiency of the FCMD-causing protein coded in the base sequence of 7389 nucleotides in the gene of a person to be tested. The FCMD-causing protein is useful in the preparation of its specific antibody.

 ò
 q
 and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methywcin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents,
 such as chemotherapeutics, Immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents a protein encoded by the macrolide biosynthetic gene cluster (pik) from
 Desosamine biosynthesis; macrolide; polyketide; methymycin; pikromycin; neomethymycin; narbomycin; polyhydroxyalkanoate monomer synthase; biopolymer; antibiotic; chemotherapeutic; immunosuppressant; asthma, chronic obstructive pulmonary disease; respiratory inflammation; hypercholesterolaemia; crop protection agent.
 comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, plkromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine
 The invention relates to an isolated and purified nucleic acid segment
 Desosamine and macrolide biosynthetic gene clusters, useful for, e .g. synthesis of methymycin and pikromycin -

This invention describes novel nucleic acid (cDNA) sequences (A) which have anticancer activity and are highly expressed in ovarian tumor tissue (and some also in testis and breast cancer tissue). The products of the invention can be used for gene therapy. (A) are used (1) for genes. (B) are used (1) to isolate complete genes. (B) are used (1) to identify agents suitable for treatment of ovarian cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the generation and the fact that ESTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of cocurrence in a particular tissue. Y76505 Y76638 represent protein fragments represented in 277450-277572.

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its bloigolally active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide blosynthetic gene cluster, or fragments thereof. The macrolide blosynthetic gene cluster encodes proteins which synthesise methymycin, plkromycin, nerobenyoin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide blosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic gene clusters are useful for synthesis of methymycin, pikromycin, neomethymycin and carbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polyketide synthesis may be useful to prepare novel antibiotics and polyketide synthesis may be monomers. The compounds produced by the recombinant host cells are useful as blopolymers, e.g., in packaging or blomedical applications, to compound by a chompt parametric immunocarie immunocarie produced by the recombinant host cells are useful and no produced by the recombinant host cells are useful and no produced by the recombinant host cells are useful and no produced by the recombinant host cells are useful and no produced by the recombinant host cells are useful and no produced by the recombinant host cells are useful and no produced by the recombinant host cells are useful and no produced by the recombinant host cells are useful and host produced by the recombinant host cells are useful and the produced by the recombinant host cells are useful and the produced by the produced by the recombinant host cells are useful and the produced by the recombinant host cells are the produced by the recombin

containing a coding sequence for a narbonolide polyketide synthase (PKS).

Polyketides are compounds synthasised from 2-carbon units through a series of condensations and subsequent modifications. Modular PKSs are responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules, and two thiosester domains. Four proteins make up the narbonolide PKS (PICAI, PICAII) and PICAIV). PICAI includes the loading module and extender modules 1 and 2, PICAII includes extender module 3 and 4, PICAII includes extender module 5 and a type II thiosesterase domain. The second type II thiosesterase domain. The second type II thiosesterase domain is found on the PICB protein. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form the recombinant cosmid pKOS023-27 (see 256001). Narbonolide is desosamine is required for this conversion, and the desosamine biosynthetic genes are also found in cosmid pKOS023-27. The recombinant combinant is required to express, in transference enzyme is required for this conversion, and the desosamine biosynthetic genes are also found in cosmid pKOS023-27. The recombinant combinant is required to express, in transference enzyme is not express, in transference enzyme is the combinant combinant combinant which is the protein of the protein is used to express, in transference enzyme is the protein of t
 narbonolide (or its derivatives) or other ketolides (particularly hybrids), which may then be converted (e.g. by other enzymes recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful in human or veterinary

 sequence. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. aeruginosa infection in the specification were poorly legible, and note: the sequences given in the specification were poorly legible, and
 Gaps
 A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated will be well as a wallows 48.2% homology to the human PTH receptor. Its shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a CDNA clone (T59619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HITDGTA can be produced in transformed host cells and used to recen for (ant)agonist cods. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism,

 Submitted (MAY-1993) to the EMBL/GenBank/DDBJ databases.

Submitted (MAY-1993) to the EMBL/GenBank/DDBJ databases.

I Submitted (MAY-1993) to the EMBL/GenBank/DDBJ databases.

I FUNCTION: THIS IS A RECEPTOR FOR PACAP-2 AND PRCAPE-3.

ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROLACTING WHICH ACTIVATE CYCLASE. MAY REGULATE THE RELEASE OF ADRENOCORTICOTROPIN, CATENIZING HORMONE, PROLACTIN, EPINEHRIN, AND CATECHOLAMINE. MAY PLAY A ROLE IN SPERMATOGENESIS AND SPERM MOTILITY. CAUSES SMOOTH MUSCLE RELAXATION AND SECRETION IN THE GASTROINESTINAL TRACT.

I SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

I SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

I HOP2, HIP AND PACAP-R; ARE PRODUCED BY ALTERNATIVE SPLICING.

HOP2, HIP AND PACAP-R; ARE PRODUCED BY ALTERNATIVE SPLICING.

I TISSUE SPECIFICITY: HYPOTHALAMUS, ANTERIOR PITUITARY, ADRENAL MEDULLA, TESTICULAR GERM CELLS.

 This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation-the Buropean Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
 FUNCTION: THIS IS A RECEPTOR FOR PACAP-27 AND PACAP-38. THE ACTIVATE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE ADENILYL CYCLASE, MAY RECULATE THE RELEASE OF ADRENOCORTICOTROPIN, LUTEINIZING HORMONE, RECULATE THE RELEASE OF ADRENOCORTICOTROPIN, LATEINIZING HORMONE, RECULATE RELEASE OF ADRENOCORTICOTROPIN, LATEINIZING HORMONE, RECULATE RELEASE OF ADDENILAR AND MOTILITY. CAUSES SMOOTH MUSCLE RELAXATION AND SECRETION IN THE GASTROINTESTINAL TRACT.
 -!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: MOST ABUNDANT IN THE BRAIN. LOW EXPRESSION IN THE LUNG, LIVER, THYMUS, SPLEEN, PANCREAS AND PLACENTA.
-!- SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS.

 ö
 AGOLI IL 14L.,
EDGOCTIONOLOGY 137:4285-4297(1996).

-I-FUNCTION: THIS IS A SPECIFIC RECEPTOR FOR PARATHYROID HORMONE. THE
ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE
ADBINYLY. CYCLASE. PTHR2 MAY BE RESPONSIBLE FOR PTH EFFECTS IN A
NUMBER OF PHYSIOLOGICAL SYSTEMS. IT MAY PLAY A SIGNIFICANT ROLE IN
PAMYREAFIC FOUNCTION. PTHR2 PRESENDE IN NEURONS INDICATES THAT IT
MAY FUNCTION AS A NEUROTRANSHITTER RECEPTOR.

-I-TISSUE SPECIFICITY: ABUNDANTLY EXPRESSED IN BRAIN, ARTERIAL AND
CARDIAC ENDOTHELIUM. FOUND AS WELL IN SPERM, IN THE HEAD OF THE
EPIDIDYLIS. LOWER EXPRESSION IS FOUND IN VASCULAR SMOOTH MUSCLE,
EXOCRINE PANCREAS, TESTIS AND PLACENTA.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A57519
parathyroid hormone receptor 2 precursor - human
N;Alternate names: PTH2 receptor
C;Species: Homo sapiens (man)
C;Date: 08-Dec-1995 #sequence\_revision 08-Dec-1995 #text\_change 24-Nov-1999
C;Accession: A57519
R;Usdin, T.B.; Gruber, C.; Bonner, T.I.
J. Biol. Chem. 270. 18455-18488, 1995
A;Title: Identification and functional expression of a receptor selectively recogniz1
A;Reference number: A57519
A;Cession: A57519
A;Status: preliminary; nucleic acid sequence not shown
A;Molecule type: mRNA
A;Residues: 1-50 <USD>
A;Cross-references: GB:U25128; NID:9887966; PIDN:AAC50157.1; PID:9887967
C;Genetics:
A;Gene: GDB:PTHR2
A;Gene: GBB:PTHR2
A;Gene: GBB:PTHR2
A;Gene: GBB:PTHR2
A;Gene: GBB:PTHR3
A;Gene: GBB:PTH

parathyroid hormone / parathyroid hormone-related peptide - North American opossum c; Species: Didelphis virginiana, Didelphis marsupialis virginiana (North American oposible: 24-Jan-1992 #sequence\_revision 24-Jan-1992 #text\_change 11-Jan-2000 c; Accession: A39286 R: Jueppner, H: Abou-Samra, A.B.; Freeman, M.; Kong, X.F.; Schipani, E.; Richards, J. Sclience 254, 1024-1026, 1991
A; Title: A G protein-linked receptor for parathyroid hormone and parathyroid hormone-A; Reference number: A39286; MUID:92054592
A; Status: preliminary; not compared with conceptual translation A; Molecule type: mRNA
A; Residues: 1-585 < JUE>
A; Cross-references: GB:M74445
C; Superfamily: glucagon receptor
C; Keywords: G protein-coupled receptor; transmembrane protein

This is the amino acid sequence of the rat pituitary adenylate cyclase activating polypeptide (PACAP) used in the method of the invention to develop products to treat hypersecretory conditions. The novel protein is a human G-protein pituitary adenylate cyclase activating polypeptide (PACAP)-like receptor for amnesiac like neuropeptides, designated HCEG445. Agonists can be used to treat amnesia and prevent nerve cell death in neuropathy to prevent and/or treat diseases such as Alzheimer's disease. G-protein coupled receptor agonists can also be used to treat shame, Parkinson's disease, acute heart failure, hypotension, urinary retention, and osteoporosis. Antagonists can be used to treat hypersecretory conditions and to create pharmacological amnesia or effect long-term memory. G-protein coupled receptor antagonists can also be used to treas hypersecretory conditions and to create pharmacological amnesia or effect long-term memory. G-protein coupled receptor antagonists can also be used to treat hypersecretory conditions and to create pharmacological amnesia or effect long-term memory. G-protein coupled receptor antagonists can also be used to treat hypertension, gagina pectoris, myocardial infarction, ulcers, asthma, allergies, psychoses, depression, migraine, vomiting, and benign prostatic

R58653 standard; Peptide; 76 AA.
 R58653;
 R58653
 The protein sequence was deduced from the cDNA sequence obtd by screening a human kidney oligo dT-primed cDNA library in lambda greening a denomic library of human placental DNA in EMBL3 with a probe comprising most of the coding sequence of rat bone parathyroid hormone/parathyroid hormone related protein (PTH-PTH-PP) receptor protein. The clone encodes a protein which may be used in a protein. The clone encodes a protein which may be used in a charappetic compsn. to inhibit activation of PTH or PTH-PP and thus reduce the level of alculum in the blood. Cpds. capable of competing with PTH or PTH-PP for binding can be identified using fragments of the and DNAs homologous to PTH DNA can be identified using fragments of the clone as probes. The sequence may be used for the prodn. of antibodies useful for the treatment, classification, prognosis and/or treatment of disorders related to the interaction between a cell receptor and a second such as in hypercalcaemia. See also R27704-16.

homology between the human, bovine and rat pituitary adenylate cyclase cativating polypeptide (PACAP) receptor proteins. The genes (07203-10) eactivating polypeptide (PACAP) receptor proteins. The genes (07203-10) encode proteins (R8865-62) of around 500-550 amino acids. The proteins contain a signal sequence which may be cleaved to produce mature proteins contain 7 hydrophobic measurements have deduced that the proteins contain 7 hydrophobic measurements have deduced that the proteins contain 7 hydrophobic clusters considered to be transmembrane domains in tandem. The gene for the bovine PACAP receptor was cloned by purifying the protein to homogeny. A probe was constructed to match the N-terminal region which was subsequently used to probe a bovine brain cDNA library to obtain a cDNA clone of the PACAP receptor. The DNA sequence was used to obtain human PACAP receptor gene was cloned by constructing to obtain human PACAP receptor gene was cloned by constructing primers based on the homology between the PACAP receptor and the vasoactive intestinal peptide (VIP) proteins. The probe was used to obtain clones from a rat brain cDNA library. The PACAP receptor can be used for fragments thereof may be used for the diagnosis of neuropathy such as a charman process. The packap receptor can be used for the diagnosis of neuropathy such as a charman contains and the account of the packap receptor can be used for the diagnosis of neuropathy such as a charman contains and the account of the packap receptor can be used for the diagnosis of neuropathy accounts of the packap receptor can be used for the account of the packap receptor can be used for the diagnosis of neuropathy accounts and the packap receptor and the packap accounts and the pa

(PTH/PTHIP) receptor (R92277) is encoded by cDNA clone R15B (T15947) isolated from a rat osteosarcoma ROS 17/2.8 cDNA library. The receptor a o-protein linked receptor having 7 transmembrane domains. It induces an increase in intracellular cAMP and calcium upon challenge with PTH or PTHrP. Recombinant receptor can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Host cells expressing the receptor are used for diagnostic measurement of PTH

 The rat bone parathyroid hormone/parathyroid hormone related protein (PTH/PTHrP) receptor protein sequence was deduced from clone R185 bothd. by screening a rat osteosarcoma (ROS) cell cDNA library to isolate those expressing functionally intact PTH/PTHrP receptor proteins, performed according to Gearing et al., (EMBO J. 8: 3676, 1989), by identifying colonies capable of binding a suitable radiolabelled ligand. The protein may be used in a therapeutic compan. to inhibit activation of PTH or PTHrP and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTHrP for binding can be identified using the protein and DNAs homologous to PHH DNA can be accorded to the competing with PTH or PTHRP for binding can be identified using the protein and DNAs homologous to PHH DNA can

 Parathyroid hormone/parathyroid hormone-related protein (PTH/PPTHP) receptors (R92775 and R92776) are encoded by CDNA clones OK-H (T15945) and OK-O (T15946), respectively, isolated from an opossum kidney (OK) cell cDNA library. OK-H and OK-O may be the products of 2 separate genes or of a laboratory artifact. The receptor induces an increase in intracellular cAMP and calcium when challenged with PTH or PTHFP. Recombinant receptors can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Most cells expressing the receptor can be used for diagnostic measurement of PTH serum levels.

 The parathyroid hormone/parathyroid hormone related protein (PTH/PTHrP) receptor protein sequence was deduced form the DNA sequence of the clone OK+H, isolated from opossum kidney (OK) cells. The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTHrP and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTHrP for binding can be identified
 Gaps
 A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a CDNA clone (T59619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium lelevels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism, hypophosphataemia, kidney stone, nephroliasis.

 PARATHYROID HORMONE/PARATHYROID HORMONE-
FUNCTION: THIS IS A RECEPTOR FOR PARATHYROID HORMONE AND FOR ARATHYROID HORMONE-RELATED REPTIDE. THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE ADDIVITY CYCLASE AND ALSO A PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER
 Gaps
 SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS.

 A rat parathyroid hormone/parathyroid hormone-related protein (PTH/PTHLP) receptor (R92277) is encoded by cDNA clone R15B (T15947) isolated from a rat osteosarcoma ROS 17/2.8 cDNA library. The receptor a G-protein linked receptor having 7 transmembrane domains. It induces an increase in intracellular cAMP and calcium upon challenge with PTH or PTH.P. Recombinant receptor can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Host cells expressing the receptor are used for diagnostic measurement of PTH serum levels.
 DNA encoding vertebrate parathyroid hormone receptor - useful for diagnosis and treatment of e.g. hypercalcaemia, hypo-calcaemia,

OK-H, which is targeted by the antibody of the invention. The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PyrH receptor. The antibody is useful for treating disorders characterised by overstimulation of PyrH receptors by their ligand and for the diagnosis of Pyr-related hypercalcaemia.
 The parathyroid hormone/parathyroid hormone related protein (PTH/PTHrP) receptor protein sequence was deduced form the DNA sequence of the clone OK-O, isolated from opossum kidney (OK) cells. The clone OK-O is identical to the OK-H clone expect at the C-terminal tail as OK-O encodes a 585 amino acid protein, OK-H encodes one of 515 amino acids. The difference is attributed to a single nucleotide deleted in the OK-B sequence causing a frame shift and an earlier stop codon. It is not known whether OK-O and OK-H represent prods. Of two separate genes or are a laboratory artifact. The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTHRP and thus reduce the

The parathyroid hormone/parathyroid hormone related protein (PTH/PTHrp) receptor protein sequence was deduced form the DNA sequence of the clone OKTH, isolated from opossum kidney (OK) cells. The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTHrp and thus reduce the level of calcium in the blood. Caps.

PTHRP and thus reduce the level of calcium in the blood. Caps. In the protein prod. and DNAs homologous to PTH DNA can be identified using fragments of the clone as probes. The protein and be used for the prodn. of antibodies useful for the treatment, classification, prognosis and/or treatment of disorders related to the interaction between a cell receptor and a ligand such as in hypercalcaemia.

 The peptide sequence shown represents an intracellular fragment of parathyroid hormone/parathyroid hormone related protein (PTH/PTHIP) receptor protein. The peptide is capable of binding PTH or PTHIP and acting as an antagonist of these cpds. The peptide may be used to inhibit activation of PTH or PTHIP and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTHIP for binding can be identified using the protein prod.
 Gaps
 human G-protein parathyroid hormone (PTH) receptor, designated HITDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a cDNA clone (159619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HITDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphateamia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to onhibit the receptor e.g. for hypophosphateament of osteoporosis, hyperacalcaemia, hypoparathyroidism, hypophosphateamia, kidney stone, nephroliasis.
 A novel 7-transmembrane receptor (W12695) has been identified as a

US-09-236-468A-2\_COPY\_310\_315 29 Title: Perfect score: Sequence:

1 SAGDIK 6

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Total number of hits satisfying chosen parameters:

182106 seqs, 63460219 residues

Searched:

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database

PIR\_65:\*
1: pir1:\*
2: pir2:\*
3: pir3:\*
1: pir4:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 TRACHEAL CELL
FUNCTION: TRANSCRIPTION FACTOR, MASTER REGULATOR OF TRACHEAL CELL
FATES IN THE EMBRYO, NECESSARY FOR THE DEVELOPMENT OF THE SALIVARY
CLAND DUCT AND THE POSTERIOR SPIRACLES. IT MAY INDUCE A GENERAL
FATE OF BRANCHED TUBBLIAR STRUCTURES OF EPITHELIAL ORIGIN. TGO/TRH
CHETRODIMERS ARE INVOLVED IN THE CONTROL OF BREATHLESS EXPRESSION.
CHANGE OF BRANCHED TUBBLIAR REQUIRES DIMERIZATION WITH ANOTHER BILLH PROTEIN. HETERODIMER WITH TGO.
CHATEROLIAR LOCATION: NUCLEAR PROTEIN.
CHATERORATIVE PRODUCTS. AT LEAST 3 ISOFORMS; 1 (SHOWN HERE), 2 AND 3; ARE PRODUCED BY ALTERNATIVE SPLICTING.
CHATERORATIVE PRODUCTS. AT LEAST OF CELLE IN THE CNS.
CHATERORATIVE PRODUCTS. SALIVARY GLAND DUCTS, POSTERIOR
SPIRACLES (FFLIXORDER PRIMORDIA) AND A SUBSET OF CELLE IN THE TRACHEAL PLACODES AT STAGE 8, AND EXPRESSION CONTINUES THROUGHOUT TRACHEAL PLACODES AT STAGE 8, AND EXPRESSION CONTINUES THROUGHOUT CHE CHAND. EXPRESSION IS OBSERVED IN THE ENTIRE GLAND AT STAGE 9 AND BY STAGE 12, EXPRESSION IS CONFINED TO THE SALIVARY DUCTS.
TRACHEAL PLACODES TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF THE BASIC PELIX (BHLH) FAMILY OF

Kyaw H, Lafleur DW, Li Y, Zeng Z; Soppet DR, Shi Y, Fischer CL, Ruben SM, (HUMA-) HUMAN GENOME SCI INC Ebner R, Rosen CA, Brewer LA, Olsen HS,

Moore PA;

## WPI; 1999-120770/10.

New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

## Disclosure; Page 61; 464pp; English.

This sequence represents a fragment of a secreted human protein encoded by the nucleic acid molecule detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. X27302) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 0.123 novel genes and their fragments (nucleic acid sequences: X27311-X27449; amino acid sequences Y02650-Y02788) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be

```
diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 123 polynucleotides, based on which tissues they are most highly expressed in (see X27311 for described
 This sequence comprises hypoxanthine phosphoribosyltransferase
(HPRT) from mouse. The HPRT gene (see T97166) was utilised in
the construction of selection vector pMSD5 HPRT, which contains
(ull-length HPRT DNA under transcriptional control of the Moloney
LIR (see also T97160). The invention provides vectors and improved
methods for the expression and co-amplification of genes encoding
recombinant proteins in cultured cells. The methods permit the
isolation of cell lines which have co-amplification proved
sequences which encode an amplifiable marker, one or more
expression vectors encoding a protein of interest and optionally a
selectable marker. The amplified cells provide large quantities of
crombinant proteins suitable for immunotherapy for treatment of
lymphomas and leukaemias. The methods permit the production of
custom vaccines, including multivalent vaccines, that reflect the

A lambda gtll library was prepared from poly-A RNA isolated from rat basophilic leukaemia cells. Probes were designed based on the sequence of a tryptic peptide of Fc(epsilon)RI beta-subunit. The longest clone was sequence (see Q14734). It predicts two possible initiation codons. To check that the true start codon was not still further 5', the cDNA library was rescreened. Of the additional 28 clones which were isolated, 6 showed early termination; this sequence was deduced from the truncated coding sequence. The first 3 amino acid residues may be absent, depending upon which of the two initiation codons is actually used.

also whether it is present in a particular fly. PCD can be induced by administration of antisense nucleic acids sufficiently complementary to inhibit translation of Daktl or PPSA mRNA present in a cell.

D. melanogaster embryos can be used to determine whether a substance is useful for inducing PCD or inhibiting cell death. Determining the presence of a nucleotide sequence encoding a trachelless protein. Daktl
 or PP2A capable of initiating transcription is used to determine a predisposition for conferring abnormal development on offspring of the subject containing the sequence. An understanding of PCD is important for determining possible new therapeutics useful against, e.g. cancer or an overactive immune system. The present sequence represents the trachealess protein which is capable of initiating transcription, and can be used in the method from the present invention.

 host cells that express the topolsomerase I at high levels, and methods for the recombinant production of topoisomerase I. The invention provides a claimed method of improving the efficiency of a reverse transcriptase (RT) based nolecular reaction by including topoisomerase I in a reaction mixture. The molecular reaction is preferably a RT-based cDNA synthesis, the RT is derived from lentivirus and the topoisomerase I is human, murine or avian (see Y06424-26). CDNA synthesis kits are claimed. Topoisomerase I can also be used to improve the integration efficiency of retrovirus vectors and hence to improve retrovirus-based gene efficiency of RT-mediated PCR.

The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents the partial fragment of B. napus Dz2B protein.

recombinant organism by transforming a suitable host cell with an expression cassette comprising either one or both of the genes encoding G3PDH and G3P, where the host cell has disruptions in either glycerol kinase or glycerol dehydrogenase endogenous genes to prevent their active expression. The transformed host cell is cultured with a carbon source and glycerol is recovered. Compounds derived from the glycerol biosynthetic pathway like 1,3-propanediol can also be produced. The method provides a rapid, inexpensive and environment-friendly source of glycerol. Glycerol is used in cosmetics, food, pharmaceuticals, lubricants, anti-freeze solutions, fat and oil industry etc. 1,3 -propanediol is used for the production of polyester fibers and the manufacture of polyurethanes and cyclic compounds.
 The present sequence is a cytosolic glycerol kinase encoded by GUTI gene which catalyses the conversion of glycerol and ATP to glycerol-3 -phosphate and ADP. This is used in the production of glycerol from a

 This Saccharomyces polypeptide comprises a cytosolic glycerol kinase that catalyses the conversion of glycerol to glycerol that catalyses the conversion of glycerol to glycerol. 3-phosphate. It is encoded by the GUT1 gene (see V30827). The invention provides recombinant organisms that express glycerol 3-phosphatase (G3P) and/or glycerol. 3-phosphate dehydrogenase (G3PDH) (see also W57324-32) useful for the production of glycerol from a variety of C-sources. A host cell is preferably transformed with a cassette containing either a G3PDH gene and/or a G3P gene and then cultured in the presence of a mono-, oligo-, polysaccharide or IC-substrate. The glycerol obtained is used in cosmetics, liquid soaps, pharmaceuticals, lubricants and antifreezes; its esters are used in the oil and fat industries. The method produces glycerol rapidly and inexpensively without generation of polluting

New method for increasing production of 1,3-propane:diol - comprises fermentation of inexpensive carbon sources by microorganism expressing dehydratase, used, e.g. to prolong half-life of enzyme
 The sequence is that of cytosolic glycerol kinase.

It was used as part of a method of fermentative production of 1.3-propanediol (1.3-pd), using an organism comprising at least 1 gene encoding a dehydratase, is improved by inserting into the host a gene encoding protein X and culturing the transformant in presence of a carbon source (e.g. mono., oligoror poly-saccharide or Ic substrate) convertible to 1.3-pd.

1.3-pd is a starting material for polyesters, polyurethanes and cyclic compounds. 1.3-pd can now be produced by a single recombinant organism from inexpensive carbon sources such as glucose (rather than costly glycerol or dihydroxyacetone), rapidly and without causing pollution.

 Cytosolic glycerol kinase GUT1 is encoded by the gut1 gene (see (V42021) of Saccharomyces sp. This enzyme catalyses the conversion of glycerol to glycerol-3-phosphate, or the reverse reaction. A claimed method for production of 1,3-propanediol (I) comprises culturing a microorganism transformed with a cassette containing at least 1 of the genes (see V42012-21) for glycerol-3-phosphate dehydrogenase, glycerol-3-phosphatese, glycerol dehydratase and 1,3-propanediol oxidoreductase (see W30676-85). Any of these genes not present on the cassette must be present endogenously. The curyme sequences may include substitutions, deletions and additions provided activity is not altered. A single recombinant organism can now be used for production of (I) from inexpensive C-sources (contrast use of glycerol or dihydroxyacetone) without causing pollution. [I) is a starting material for polyesters, polyurethanes
 Gaps
 Fermentative production of 1,3-propanediol - by single organism containing cassette comprising specific genes, and capable of using inexpensive carbon sources

Haemophilus paragallinarum strain C-53-47. The antigenic protein stimulates the production of HI antibodies in fowl. The protein and DNA coding for it can be used in the preparation of vaccines for the prevention of chicken infectious coryza (CIC). The protein and its antibodies can be used in the diagnosis and treatment of CIC.

 Gaps
 Antigenic polypeptide from Haemophilus paragallinarum induces HI antibody production - and is useful for diagnosis of and preparation of vaccines for chicken infectious coryza
 A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a cDNA clone (T59619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or
 treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypophataemia, kidney stone, nephroliasis.
 The present sequence represents an antigenic protein derived from
 hyper-calcaemia, hypo- or hyper-phosphatemia, kidney stones, etc

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 This sequence represents a signal recognition protein, fisy, isolated from Staphylococcus aureus, which is a component of the protein secretory apparatus of bacteria. First polypeptides and polynucleotides are useful for diagnosing diseases related to activity or expression of first protein by determining a nucleic acid sequence encoding the polypeptide, or analysing for the presence or amount of first polypeptide due to an infection of an organism with the first gene (claimed). They can diagnose the stage and type of infection. First polypeptides are also useful for screening for compounds which affect activity of the protein by measuring the binding to the polypeptide and observing the stimulation or compounds which affect activity of the protein by measuring the binding to the polypeptide and observing the stimulation or confounds which affect activity of the protein by measuring the binding to the polypeptide function. These can be used in treatment to inhibition of the polypeptide function. These can be used in treatment to confultions associated with a lack of first polypeptides to channer (attact conditions associated with a lack of first polypeptides or direct administration of first confunctions associated with a lack of first polypeptides (administered directly, in a vector and as a vaccine) and antibodies induce an immune response to immunise and prevent disease.

Colseases diagnosed, prevented or treated include bacterial infections, especially Staphylococcus aureus infections which cause abscesses, bactermia, obseomyelitis, septic arthritis, septic thrombophlebitis, coute bacterial endocarditis, food poisoning, scalded skin syndrome and coute bacterial endocarditis, food poisoning, scalded skin syndrome and contains and bacterial debacterial debacterial debacterial adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial

```
The amino acid sequence of the maltose binding protein-human calmodulin fusion protein CDNA in clone pAALCAM. The clone was generated by cloning the calmodulin cDNA (995549) into the plasmid pMAL(RTM)-2. The calmodulin cDNA was also cloned into the plasmids pRT2T and pGEX.5X-1 to generate plasmids pPACAM (09551) and pGSTCAM (095552) which produce protein A (R78525) and glutathione-S-transferase-calmodulin (R78526) tusion proteins, respectively. The fusion proteins produced retain the activity as calmodulin as measured by the phosphodiesterase activating method. The fusion protein, obtainable at high purity, can be used to isolate calmodulin binding proteins, measure their activity and screen for calmodulin inhibitors.
 Gaps
 Fusion of calmodulin (CAM) with specific binding peptide - has same activity as CAM, useful for screening for CAM inhibitors, measuring CAM binding protein activity, etc.

This invention describes novel binding partners (A) (i) for negative factor protein (Nef) that competitively inhibit binding of calmodulin (I) to Nef, or (ii) for (I) that competitively inhibit binding of Nef to (I). A) are used for prevention, diagnosis (by specific detection of intraand/or extra-cellular Nef, including staging of infection), and/or treatment of infections with human immune deficiency virus (HIV).
 protein; biosynthetic antibody binding site;
 The sequence is a biosynthetic multifunctional protein including a biosynthetic antibody binding site and calmodulin protein trailer linked via a spacer sequence.

 This is the amino acid sequence of the product of the spnD gene. The protein is involved in spinosyn biosynthesis. The SpnD gene is one of 23 genes and open reading frames contained in an 80kb DNA sequence 221501.

Spinosyns are insecticidal microlides which are useful for the control of arachnids, nematodes and insects. Biosynthesis of spinosyns occurs via stepwise condensation and modification of carboxylic acid precursors generating a linear polyketide which is modified further. The DNA sequence contains a central region of approximately 55kb which has homology to the DNA encoding the polyketide synthases (PKS) of known macrolide producers. The spinosyn PKS DNA region consists of 5 ORFs with stop codons at the end of acyl carrier protein (ACP) domains. Together the PKS polypeptides (Y39297-Y39301) of which this sequence is one, form a complex consisting of an initiator module, spnA, and several extender modules spnB-spnE. Each extender module adds a specific acetyl Co-A precursor to a growing polyketide chain, and modifies the beta-keto group in a specific manner. A module in a PKS polypeptide consists of several canners with specific functions. The initiator module has an acyl cransferase (AT) domain, and an acyl carrier protein (ACP) domain. The extender modules have the same domains plus a beta-ketosynthase (KS) domain and optionally a beta-ketoreductase domain, a delydratese (DH)
 New spinosyn biosynthetic genes from Saccharopolyspora spinosa, useful for production of insecticidal spinosyn compounds

spinosyns, and for creating new spinosyns e.g. by mutagenesis, or interruption of steps in spinosyn biosynthesis. The modified spinosyns may be a new insect control agent or serve as substrates for further chemical modification and the creation of new semi-synthetic spinosyns. The genes are also useful to isolate similar sequences from S. spinosa or other species by hybridization.
 Gaps

 designated the ygjD family, after the name given to the Escherichia coli family member. These proteins are essential for the survival of both Gram negative and Gram positive bacteria, although no function has as yet been ascribed to these proteins. The ygjD proteins, fragments of ygjD proteins (for example, fragments encompassing one or more conserved ygjD mortis such as Y2218 *75284) and nucleotides encoding them can be used to identify antagonists and broad spectrum antibacterial compounds. These antagonists and compounds can be used to treat a wide range of bacterial infections. New antibiotics are urgently needed, as serious bacterial infections and antibiotic resistant strains are becoming increasingly prevalent. The proteins of the invention are essential proteins for bacterial viability, and represent new targets
 The present sequence represents the protein encoded by open reading frame (ORP) E. from M. tuberculosis. This ORF E has been found to have homoogy with ORF E of a novel polynucleotide sequence designated "GS". GS is a pathogenecity island of 8 kb of DNA comprising a core region of 5.75 kb with multiple ORFs and an adjacent transmissable element of 2.5 kb. The

 A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a cDNA clone (T59619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism, hypophosphataemia, kidney stone, nephroliasis.

Target come to the second to the partial sequence of the calcum a found mainton to the sequence of the calcum and sequenced. Primers were designed to extend the partial sequence full length using selected human cDNA libraries. This sequence crepresents a consensus. The CAB protein is a member of the calcum binding protein (CBP) superfamily, characterised by the presence of an structural homologies with human CHP and rat p22 proteins. CHP regulates a protein (MHE 1) which activates cell proliferation, differentiation and neoplastic transformation. p22 is thought to be a regulator of constitutive endocytotic events. CAB is expressed in proliferating tissue and also in reproductive, hemopoietic/immune, cardiovascular, gastrointestinal, brain, bladder and kidney tissue. CAB therefore appears to play a role in apoptotic, neoplastic, immunological and reproductive disorders include acquired immunodeficiency syndrome (AIDS). Alzheimer's disease and parkinson's disease. Neoplastic disorders include leukaemia, lymphoma, melanoma and mysloma. Immunological disorders include and parkinson's disease. The production and disorders include infertility, prolactin specifically bind to CAB are useful for diagnosis of disorders associated with CAB, or in assays to monitor treatment involving cantly and or CAB inhibitors.

 EDGOCTIOLOGY 137:4285-4297(1996).

FINCTION: THIS IS A SPECIFIC RECEPTOR FOR PARATHYROID HORMONE. THE ACTIVITY OF THIS RECEPTOR IS MEDICATED BY G PROTEINS WHICH ACTIVATE ADENIE FOR PROPER PROPERS. BY ADENIE RESPONSIBLE FOR PTH EFFECTS IN A NUMBER OF PHYSIOLOGICAL SYSTEMS. IT MAY PLAY A SIGNIFICANT ROLE IN PANCREATIC FUNCTION. PTHAZ PRESENE IN NEWRONS INDICATES THAT IT MAY FUNCTION AS A NEUGATRANSMITTER RECEPTOR.

-I- TISSUE SPECIFICITY: ABUNDANTLY EXPRESSED IN BRAIN, ARTERIAL AND CARBIAC ENDOTHELIUM. FOUND AS WELL IN SPERM, IN THE HEAD OF THE EPIDIDYMIS. LOWER EXPRESSION IS FOUND IN VASCULAR SMOOTH MUSCLE, EXOCRIME PANCREAS, TESTIS AND PLACENTA.

-I- SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPPORS.

 papillomavirus genomes.";
J. Virol. 46:557-566(1983).
-i- FUNCTION: ATP-DEPENDENT DNA HELICASE REQUIRED FOR INITIATION OF VIRAL DNA REPLICATION. IT FORMS A COMPLEX WITH THE VIRAL E2 PROTEIN. THE E1 E2 COMPLEX BINDS TO THE REPLICATION ORIGIN WHICH CONTAINS BINDING SITES FOR BOTH PROTEINS.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

outer surface protein C precursor - Lyme disease spirochete (strain PLe)
C;Specias: Borrealia burgdorferi (Lyme disease spirochete)
A;Variety: strain plue
C;Date: 15-Feb-1997 #sequence_revision 27-Feb-1997 #text_change 26-May-2000
C;Accession: S69932, 572673
A;Julia - Relipke, S: Liegl, G: Preac-Mursic, V.; Roessler, D.; Schwab, E.; Soutschek

## ALIGNMENTS

```
Parathyroid hormone receptor 2 precursor - human
N.Alternate names: PTHI receptor
C.Species: Homo sapiens (man)
C.Date: 08-Dec-1995 #sequence_revision 08-Dec-1995 #text_change 24-Nov-1999
C.Accession: A57519
R.Usdin, T.B.; Gruber, C.; Bonner, T.I.
J. Biol. Chem. 270, 13455-15458, 1995
A.Title: Identification and functional expression of a receptor selectively recognizi
A.Recence number: A57519; MUID:95318121
A.Accession: A57519; MUID:95318121
A.Accession: A57519; MUID:96318121
A.Residues: preliminary; nucleic acid sequence not shown
A.Molecule type: mRNA
A.Residues: 1-550 < USD>
A.Cross-references: GB:U25128; NID:9887966; PIDN:AAC50157.1; PID:9887967
C.Genetics:
 A)Gene: GDB:PTHR2; PTHR2R
A)Cross-references: GDB:731977; OMIM:601469
A)Map position: 243-2433
C;Superfamily: glucagon receptor
C;Keywords: hormone receptor

Immunogenic serine rich E.histolytica protein.

```
The amino acid sequence is that of a serine rich E. histolytica protein (SREHP). It is encoded by ORF1 of the c1 CDNA clone obtd. from E. histolytica. It is a surface membrane antigen of E. histolytica and can be used in a serologic test for invasive amoebiasis. It can also be used for the prodn. of antibodies.
 New immunogenic protein from Entamoeba histolytica - used to diagnose amoeblasis serologically.

The DNA encoding prochymosin can be cloned into a plasmid (esp from S. cremoris SK112) and used to produce large amts of the protein by recombinant DNA techniques. The protein synthesis is driven by the regulatory region of this proteinase. This could overcome the shortage of prochymosin due to a shortage of calf stomachs and increasing cheese produ. Prychymosin is also used in prodn. of yoghurt, butter and
 DNA fragment having region specific for lactic acid bacteria is contained in plasmid in microorganism used in prodn. of protein and food prodn. eg cheese.

 New isolated phospatidyl inositol-3 kinase polypeptide - used to develop products for diagnosis and therapy, particularly for proliferative disorders, e.g. inflammatory joint diseases, or cancer
 A novel 7-transmembrane receptor (W12695) has been identified as a human G-profein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a cDNA clone (F56619) isolated from a human T cell Iymphoma tissue CDNA library. Recombinant HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hypoprabogarathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for

to inhibit
 Gaps
 Inositol 4-phosphate, but not in phosphatidyl inositol
4,5-bisphosphate, and which are involved in cell signalling
cascades that control e.g. cell cycle progression and intracellular
protein sorting. The amino acid sequence was deduced from an
isolated cDNA sequence (see T80200). It shows 34% identity and
48% similarity to mouse cpk·m (see W38756). Novel phosphatidyl
inositol 3-kinases can be used to screen for agonists/antagonists
of activity and in a claimed method freating a disorder caused
by dysregulation of a growth factor activation signalling cascade.
Antagonists may reduce Ras activation allowing treatment of
 5.6 kpp EcoRI-Sall insert from pSRQ220. This vector contains three ORFs, the first encoding a bacteriocin precursor, and the others needed for correct protein assembly to obtain functionally active bacteriocin. The bacteriocin from Pediococcus acidilactici NRRL-B-18050 is used in foods to inhibit bacterial spoilage, e.g. to inhibit Listeria monocytogenes.
 proliferative disorders such as atherosclerosis, inflammatory joint disease, psoriasis, restenosis following angioplasty, and cancer.
This protein sequence comprises cpk, a Drosophila polypeptide that belongs to a novel class of phosphatidyl inositol 3 kinases that contain a C2 domain, are capable of phosphorylating a D3 hydroxyl of an inositol ring in phosphatidyl inositol and phosphatidyl
 protein sequence was deduced from the third ORF encoded by the
 Cloned gene from Pediococcus acidilactici - encodes bacteriocin

C III S MEDLIANE DE RESPONSIBLE FOR PHICH ACTIVATE

ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE

ACTIVITY OF THIS RECEPTOR IS MEDIATE BY A SIGNIFICANT ROLE IN

NUMBER OF PHYSIOLOGIAL SYSTEMS. IT MAY PLAY A SIGNIFICANT ROLE IN

PANCREATIC FUNCTION. PHR2 PRESENCE IN NEURONS INDICATES THAT IT

MAY FUNCTION AS A NEUROTRANSMITTER RECEPTOR.

C II TISSUE SPECIFICITY: ABUNDANTLY EXPRESSED IN BRAIN, ARTERIAL AND

C CARDIAC ENDOCHELIUM. FOUND AS WELL IN SPERM, IN THE HEAD OF THE

EPIDIDYMIS. LOWER EXPRESSION IS FOUND IN VASCULAR SMOOTH MUSCLE,

EXCERNE PANCREAS, TESTIS AND PLACENTA.

C II SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS.

```
The amino acid sequence of the novel porcine vasoactive intestinal peptide (pVIP) receptor. The gene was isolated from a cDNA library in the Superscript (RTM) Lambda System derived from porcine lung tissue RNA using a 700 bp probe amplified from lung tissue cDNA using primers 089547-8. The gene was inserted into the plasmid pSPORT for sequencing. Thereafter the gene was inserted into the plasmid pSPORT for sequencing transfection of 293 cells and production of the recombinant protein. The activity of pvIP is linked to vasodilation in the lungs and gastrointestinal tract. The receptor is useful in a bioactivity assay for quantifying the level of stimulation and repression of pvIP enzymatic activity in response to test compounds. The receptor is also useful in screening for pVIP receptor inhibitory or stimulatory agents.

R30187 standard; Protein; 449 AA.
 RESULT
R30187
 The protein sequence was deduced from the CDNA sequence obtd by screening a human kidney oligo dT-primed CDNA library in lambda genomic library of human placental DNA library in lambda probe comprising most of the coding sequence of rat bone parathyroid normone related protein (PTH/PTHTP) receptor protein. The clone encodes a protein which may be used in a therapeutic compsn. to inhibit activation of PTH or PTHTP and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTHTP for binding can be identified using fragments of the clone as probes. The sequence may be used for the protein prod. and DNAs homologous to PTH DNA can be identified using fragments of the clone as probes. The sequence may be used for the prodn. of antibodies useful for the treatment, classification, prognosis and/or treatment of disorders related to the interaction between a cell receptor and a ligand such as in hypercalcaemia. See also R27704-16.

basic
 The secretin receptor was encoded by a DNA sequence of rat origin, contained in rat/mouse hybridoma NG108-15. The DNA sequence was obtd. from a CDNA library derived from NG108-15 cells. Expression in a suitable host allows prodn of the receptor protein. The secretin receptor protein encoded by this gene may be used in basic research and in clinical tests, and is available in high yield.
 DNA coding for secretin receptor – is expressed in COS cells and produces a receptor protein for research and clinical use

 A human parathyroid hormone/parathyroid hormone-related protein (PTH/PTHTP) receptor (R92278) is encoded by CDNA clone HK-1 (T15948) isolated from a human kidney CDNA library. The receptor induces an increase in intracellular cAMP and intracellular free calcium when challenged by PTH or PTHTP. Recombinant receptor can be produced in vector/host cell systems and used in the treatment, dlagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to expressing the receptor can be used for diagnostic measurement of
 DNA encoding vertebrate parathyroid hormone receptor - useful for diagnosis and treatment of e.g. hypercalcaemia, hypo-calcaemia,

 This sequence represents the human parathyroid hormone (PTH) receptor which is targeted by the antibody of the invention. The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PTH receptor. The antibody is useful for treating disorders characterised by overstimulation of PTH receptors by their ligand and for the diagnosis of PTH-related hypercalcaemia.

4A encoding parathyroid hormone receptor, DNA and antibodis (differential) diagnosis of hypercalcaemia, and diagnosis

```
The rat bone parathyroid hormone/parathyroid hormone related protein (PTM/PTHIP) receptor protein sequence was deduced from clother R15B obbtd. by screening a rat osteosarcoma (RSO) cell cDNA library to isolate those expressing functionally intext PTM/PTHIP receptor proteins, performed according to Gearing et al., (EMBO J. 8: 3676, 1989), by identifying colonies capable of binding a suitable radio. Labelled ligand. The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTHIP and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTHIP for binding can be identified using the protein and DNas homologous to PTH DNA can be identified using the protein and DNas homologous to PTH DNA can be identified using the protein and DNas homologous to PTH DNA can be identified using fragments of the clone as probes. The sequence may be used for the prodn. of antibodies useful for the treatment, classification, prognosis and/or treatment of disorders related to the interaction between a cell receptor and a ligand such as in hypercalcaemia.  This sequence represents the rat parathyroid hormone (PTH) receptor R15B, which is targeted by the antibody of the invention. The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PTH receptor. The antibody is useful for treating disorders characterised by overstimulation of PTH receptors by their ligand and for the diagnosis of PTH-related hypercalcaemia.

 A rat parathyroid hormone/parathyroid hormone-related protein (PTH/PTHrP) receptor (R92277) is encoded by cDNA clone R15B (T15947) isolated from a rat osteosarcoma ROS 17/2.8 cDNA library. The receptor a G-protein linked receptor having 7 transmembrane domains. It induces an increase in intracellular cAMP and calcium upon challenge with PTH or PTHPP. Recombinant receptor can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Host cells expressing the receptor are used for diagnostic measurement of PTH
 DNA encoding vertebrate parathyroid hormone receptor - useful diagnosis and treatment of e.g. hypercalcaemia, hypo-calcaemia,

The parathyroid hormone/parathyroid hormone related protein (PTH/PTHrP) receptor protein sequence was deduced form the DNA sequence of the clone OK+1, isolated from opossum kidney (OK) cells. The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTHrP and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTHrP for binding can be identified using the protein prod. and DNAs homologous to PTH DNA can be identified using fragments of the clone as probes. The protein may be used for the prodn. of antibodies useful for the treatment,

 receptor protein sequence was deduced form the DANA sequence of the clone OK-0, isolated from opossum kidney (OK) cells. The clone OK-0 is detailed from opossum kidney (OK) cells. The clone OK-0 clone OK-0 clone exept at the C-terminal tail as OK-0 encodes a 585 amino acid protein, OK-H encodes one of 515 amino acids. The difference is attributed to a single nucleotide deleted in the OK-H sequence causing a frame shift and an earlier stop codon. It is not known whether OK-O and OK-H represent prods. Of two separate genes or are a laboratory artifact. The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTHPP and thus reduce the compsn. to inhibit activation of PTH or PTHPP and thus reduce the or PTHPP for binding can be identified using fragments of the Colons as probes. The sequence may be used for the prodi. of antibodies useful for the treatment, classification, prognosis and/or treatment of disorders related to the interaction between a cell receptor and a ligand such as in hypercalcaemia. See also R27704-16.

 This sequence represents the opossum parathyroid hormone (PTH) receptor OK-O, which is targeted by the antibody of the invention. The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PTH receptor. The antibody is useful for treating disorders characterised by overstimulation of PTH receptors by their ligand and for the diagnosis of PTH-related hypercalcaemia.

 A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a CDNA clone (T59619) isolated from a human T cell lymphoma tissue CDNA library. Recombinant HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cods. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism, the cheatent of osteoporosis, hypercalcaemia, hypoparathyroidism,

Parathyroid hormone/parathyroid hormone-related protein (PTH/PTHFP) receptors (R92275 and R92776) are encoded by cDNA clones OK-H (T15945) and OK-O (T15946), respectively, isolated from an opossum kidney (OK) cell CDNA library. OK-H and OK-O may be the products of 2 separate genes or of a laboratory artifact. The receptor induces an increase in intracellular cAMP and calcium when challenged with PTH or PTHFP. Recombinant receptors can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Measurement of PTH serum levels.
